ABSTRACT

Plagiarism detection has become an essential requirement in academic, publishing, and professional environments to ensure originality and maintain content integrity. This project presents a **Word-Level Plagiarism Checker for Short Documents** that identifies copied and lightly paraphrased text in essays, abstracts, reports, and other short documents by comparing them against a reference corpus. Unlike systems that detect only exact matches, the proposed solution is designed to recognize reordered words, synonym-based substitutions, and partial similarities while accurately identifying the source of each plagiarized text segment. To meet project constraints, the implementation avoids the use of prebuilt library data structures and instead employs custom data structures and efficient string-processing algorithms. The system is optimized for fast execution, enabling interactive plagiarism analysis with detailed similarity reports. By combining accuracy, efficiency, and source attribution, the proposed plagiarism checker provides a practical and reliable tool for instructors, editors, and publishers to evaluate document originality and detect potential cases of plagiarism.
